Isolation and purification of basic antibiotics. Josef Hoffman, Zdeněk Ševců, and Miroslav Hefman, Czech. 84,708, Nov. 1, 1955. Fermentation medium (100 l.) contg. 232 streptomycin (I) units/ml. was filtered. The filtrate was stirred 30 min. with 1.5 kg. powder C and filtered by suction. The cake was extd. 5 times with 4 l. of 2% HCl. The combined filtrates were adjusted with solid NaHCO₃ to pH 6.5 and filtered to yield a soln. contg. 550 I units/ml. This soln. was successively shaken with 4 l. Bu acetate (2 + 1 + 1) contg. 500 g. Na dibutylphthalene sulfonate divided in the same ratio. The combined exts. were treated with 100 ml. of 50% soln. of p-quinone sulfate in MeOH stirred vigorously 10 min., and after standing for 20 min., the lower phase contg. MeOH soln. of I sulfate was sepd. The extn. was repeated 4 times yielding at the end 411 ml. of thick yellowish liquid which was poured into 4 l. MeOH. The pptd. I weighed 21.8 g. and assayed 450 units/mg. Reptn. from water with MeOH gave 16 g. white product which assayed 610 units/mg. L. I. Urbánek.

NOTHING TO SEE

Removal of hypotensive substances from streptomycin solution. Josef Hoffmann, Jitka Šapková, Miroslav Holmanský, and Zdeněk Ševčík. Czech. 84,709. Nov. 1, 1959. Crude streptomycin sulfate (10 g., 475 units per mg.) with a content of hypotensive substances corresponding to 1700 γ histamine (I) was dissolved in 50 ml. water. After adding 3.3 g. powdered silica gel (II) the pH of the mixt. was adjusted to 7.5 with 10% NaOH and stirred 1 hr. It was filtered off and washed with water. The combined filtrates were adjusted to pH 6.0 with 1% H₂SO₄ and lyophilized. The product contained 0.2 γ I activity per 100 mg. L. J. Urbanek.

HOFFMAN, J.

/ Purification and isolation of basic antibiotics
Hoffman and Jilka (Czech 84 779) have reported the isolation of basic antibiotics, especially streptomycin, from the culture of *Streptomyces* with alk. salts of anionic polymers, especially sodium acetate, and the ppt. is then decomposed with dil. acetic acid. Fermentation medium (5 l.) contg. 400 g. of substrate was acidified with 10% HCl to pH 2.0 and filtered. The filtrate was stirred 15 min. with 150 g. of NaOH, adjusted with NaOH to pH 6.0, and filtered again. To the filtrate contg. 420 units/ml. was added a 50% aq. soln. of polymethacrylic acid (II) until a ppt. ceased to form. The resulting ppt. was filtered off, washed with water, and suspended in 30 ml. water acidified to pH 2.0 with 10% HCl. After sepg. II by filtration, the soln. was neutralized by ion exchange and lyophilized to yield 16 g. I-HCl which assayed 398 units/mg. (1.1).

HOEFMAN - J.

✓ Isolation of streptomycin on ion exchangers. Josef Hoefman, Jitka Čapková, Miroslav Holmanský, and Zdeněk Ševců. Czech. 85,067, Dec. 1, 1956. Neutral filtrate medium (3% l.) from submerged fermentation with *Streptomyces griseus* contg. 470 streptomycin (I) units/ml. was passed over 500 g. of carboxylic cation-exchange resin. The column was washed with water and eluted first with 0.1 N H₂SO₄ until the eluates reached pH 3 and then with 0.2 N H₂SO₄ taking 500-ml. fractions. The I-rich fractions nos. 5-11 were combined, decolorized with C, and neutralized with CaCO₃ to pH 6. After adding 3 l. MeOH to facilitate removal of CaSO₄, I sulfate was pptd. in this filtrate with 3 l. MeOH, collected, and dried to yield 110.5 g. of a product which assayed 620 I units/mg. (the yield was 94%).

Hoffman, Josef.

Streptomycin preparation for oral use. Milos Hecim,
Josef Hoffman, and Miroslav Hecmansky. Czech. 85,180,
Feb. 18, 1958. The combination of streptomycin (1) with
bile acids yields preps. showing good therapeutical re-
sults, notably a diminished no. of T-resistant strains. A
soln. of 9.73 g dihydro-I sulfate in 5 ml H₂O was used to
treat with a satd. soln. of NaOH. After removing H₂SO₄,
the mixture was treated with 1.4 g cholic acid dissolved in 5
ml H₂O. The mixture was then filtered and the
filtrate was dried. The residue was then dried.

Title : Antibiotics with Direct Penetration into the Lymphatic System.

Orig Pub: Antibiotiki, 1958, 3, No. 1, 45-51

Abstract: Antibiolymphins (I) are salts of antibiotics with high-molecular-weight substances. The salts of streptomycin and neomycin with polymethacrylic acid, with dextran sulfate and carboxymethylstarch were tested. I are absorbed in intramuscular introduction to a considerable degree by means of the lymphatic system. As compared with commonly used antibiotics, they create lower concentrations of antibiotics in the blood and cir-

PERIODICAL: Referativnyy zhurnal, Khimiya, no. 5, 1963, 58 abstract 58405
(Acta phys. Acad. scient. hung., 1961, v. 13, no. 4, 381 - 419)

TEXT: The energy of a finite real crystal is expressed as the energy of fusion of atoms with vacancies. This energy is a function of the concentration of vacancies and the size of the crystal blocks. In several sizes of blocks, the energy-entropy curve displays two breaks. In these instances, the melting temperature is determined as a common tangent, while the entropy of fusion is the interval between two points of the tangency. A mandatory condition for normal melting is a definite size of blocks. The results obtained for alkalies, noble metals and diamonds, are in favorable agreement with the experimental data. Author's abstract.

Hoffman W. The Architecture of Waterway Structures.

"O architektura budowl wodnych" Architektura. No. 3, 1954, pp. 119-129, 31 figs.

A short report on the activities of a group of architects engaged in planning waterway structures (dams, power plants, locks, landing-stages, quays, etc.). Revolutionary has been the collaboration with the group of numerous experts (hydrotechnicians, hydromechanics, physical planners, town planners, economists, agricultural engineers, foresters and farmers); conceptions hitherto prepared did not, in spite of their unquestionable importance in economic reconstruction and the transformation of local natural surroundings, and in spite of their constituting an important plastic element in the landscape, take into consideration other factors linking waterway structures with the environment.

TITLE: A 256-channel time-of-flight analyzer of pulses with magnetic memory

SOURCE: Nukleonika, v. 8, no. 10, 1963, 695-707

TOPIC TAGS: time-of-flight analyzer, magnetic memory, arithmetic unit, digital to analog conversion, read-out, print-out, automatic print-out, monostable trigger, bistable trigger, self-blocking oscillator, pulse coincidence, square wave ferrite core, magnetic state, counting, checking, oscilloscope, decade read-out, block, gate, address register, cancel, selector, electronic selector, delay line, coordinate gate

ABSTRACT: A 256-channel analyzer is described which segregates pulses according to the time elapsed from instant zero to the instant at which they are recorded. This device is equipped with a magnetic memory, which makes it possible to perform also an amplitude analysis. The design was developed by a group of engineers and technicians at the Zaklad Elektroniki Instytutu Badan' Jadrowych

Card 1/43

ACCESSION NR: AP4015839

(Department of Electronics at the Institute of Nuclear Research) in Warsaw. The main function for which the apparatus is programmed -- the time-of-flight analysis -- is performed by a magnetic memory and associated circuitry. The memory is of the coincidence type and consists of 16 plates with 16 x-coordinate windings and 16 y-coordinate windings. At the 256 intersections on each plate there are cores, each with additional two windings: one for signal and one for blocking. Three current pulses, "read", "print" and "block" are transmitted to the x- and y-coordinate windings; only a coincidence of currents in both coordinates changes the state of magnetism in square-wave ferrite cores. Such coincidence occurs only in the cores located at the intersection of those coordinates. The reading and printing operations require only 16 microseconds. The pulse to be analyzed actuates a set of gates and a self-blocking oscillator GS 2, which in turn prepares the arithmetic unit for receiving information. This oscillator also generates a pulse which goes into the delay line and from there successively into five separate circuits: 1) a monostable trigger circuit; 2) another self-blocking oscillator GS+1 which, together with the trigger circuit, opens the gates of the arithmetic unit; 3) a second monostable trigger which generates the negative pulse "block"; 4) a positive pulse "print" is generated simultaneously, which combined with negative "block" pulse allows new information to pass from the

Card 2/103

ACCESSION NR: AP4015839

arithmetic unit into the memory; 5) a third self-blocking oscillator GS3 which, before 16 microseconds is up, is triggered and will correct the state of the address register and of the electronic selector 1, reopens gate 1 and the input gates. These are only the major components of the analyzer and the entire sequence of time-of-flight analysis proceeds by way of additional gating and switching. The device is designed and built so as to be able to carry out 6 other programs of operation. These are auxiliary programs which are initiated by selector switching at the front panel. They are: 1) checking, 2) oscilloscope, 3) decade read-out, 4) analog print-out, 5) supplementing, i.e. converting the actual counts of all channels into their supplements to the full channel capacity, and finally, 6) automatic print-out consisting of two stages, the preparation of analyzer data and actual print-out on the press; the latter operation requires command mechanisms for "start printing" and "stop printing" also automatic switch off after the entire contents of all 256 channels has been printed out. The Original article contains 9 diagrams.

TITLE: Application of the 256-channel time-of-flight analyzer for measurement of amplitude spectra

SOURCE: Nukleonika, v. 10, no. 8, 1965, 535-540

TOPIC TAGS: analog digital converter, multichannel analyzer, electromagnetic memory, radiation counter, gamma radiation

ABSTRACT: A 256-channel time-of-flight analyzer developed in the period 1960-1962 has since undergone considerable modification, including its adaptation for analyzing pulse-height spectra. This modification was made possible by the addition of an analog-digital converter which transforms pulse height into a series of pulses 1/2 microsecond apart, the number of pulses being equal to 256 for a 100 volt input signal. The analyzer can store a spectrum in 256 channels, or in either half (128 channels) of its memory. The analyzer dead time is $(18 + 0.5N)$ microseconds where N is the number of "channels" of pulse height (128 or 256 maximum). A maximum of $2^{16}-1$ (65535) counts per channel can be stored, at which point the analyzer is automatically turned off to avoid overflow. The integral linearity is about 0.2% for 256 channels and 0.35% for 128 channels, the differential linearity is within $\pm 2\%$ over most of the range, and the stability was found to be within 0.1% over a

Card 1/2

L 32094-66

ACC NR: AP602062

7 hour test period. The spectrum can be seen during analysis, in that each count produces a "light spot" during storage of the pulse height information. Also, an oscillogram of the gamma-radiation from Cs 137 is reproduced; it was obtained by using this instrument. Orig. art. has: 6 figures. [NA]

TOPIC TAGS: multichannel analyzer, electronic test equipment

ABSTRACT: A 256-channel analyzer, originally completed in 1962, has since undergone a series of modifications and improvements, the most important of which are described in this communication. These include the widening of the time channels to 2, 4, 8, 16, 32, or 64 μ seconds; the proper phasing of the analyzer after each event to avoid timing errors for subsequent counts in each cycle; the splitting of analyzer into two halves with the possibility of comparing on an oscilloscope the spectra stored in the two halves; and the capability of delaying the measuring cycle by as much as 15 times the duration for a single cycle. TITLE: Checking the mechanical properties of large cast blades of Kaplan turbines

SOURCE: Strojirenstvi, v. 15, no. 2, 1965, 138-143

TOPIC TAGS: turbine blade, metal casting, metal property, solid mechanical property, mechanical engineering

ABSTRACT: The mechanical properties of large cast blades for Kaplan turbines can be checked by measuring the attenuation of ultrasonic signals in the casting. The method described reveals the actual mechanical properties of the casting and not just those of a sample cut out of a riser; samples from risers do not provide reliable information because there is a different crystallization process in them. This work was presented by Dr. J. Ruzicka. Orig. art. has: 10 figures, 6 tables. [JPRS]

TITLE: Analysis of the effect exerted by a variable heat-transfer coefficient upon the heating process carried out with a cylindrical body. Part I.

SOURCE: Academia scientiarum hungaricae. Acta technica, v. 51, no.1-2, 1965, 163-180

TOPIC TAGS: heat radiation, heat convection, heat transfer coefficient

ABSTRACT:

The temperature distribution in a long cylindrical body is determined for the case of a stress-relieving anneal. The heat transfer coefficient is considered as a function of temperature. The influence of both radiation and convection are taken into account. The character of the boundary value proposition is nonhomogeneous and nonlinear. The solution is found by linearizing the curve section by section on the basis of a resulting formula which has already been published by the author (Ibid., Vol 40, 1962, pp 285-300). Orig.art. has: 6 figures, 10 formulas, 7 tables.

 : Brucellosis
 Orig. Pub. : Acta veterin. Acad. sci. hung., 1957, 7, No 3, 309-318
 (in German)
 Abstract : Mice were immunized with vaccine from N19 strains which
 came from different countries. After immunization with
 vaccine made from the S-type of brucellae, an average of
 25% of the mice died after subsequent infection with
 Brucella abortus; after immunization with vaccine made
 of type R brucellae, 73% of the mice died (in the
 controls, 80%). Brucellae were isolated in 71-94% of
 the cases from the blood of the heart and internal organs
 of surviving mice, most often from the spleen. The degree
 of success in plating the brucellae out of mouse organs
 was the same regardless of the infecting strain. The
 vaccine made from the S-strain protected the mice against

"An Institution for the Treatment of Tuberculous Adolescents"

Budapest, Orvosi Hetilap, Vol 104, No 7, 17 Feb 1963, pp. 313-316.

Abstract: Owing to the decrease in the number of tuberculous infants, the hospital located at the Freedom Mountain (Szabadszághely), near Budapest, has been designated as an institution for the treatment of tuberculous adolescents only. The article reviews the reasons for this decision. Facilities include training courses in grade- and high-school subjects; also in sewing, gardening, photography, etc. By transferring adolescents from institutions for adults a significant number of hospital beds were made free for more efficient use. No references.

"Diagnostic Procedure for the Determination of the Completeness of Rectal
Fistulae."

Budapest, Magyar Sebészet, Vol XVI, No 4, Aug 1963, pages 241-243.

Abstract: [Author's Hungarian summary] During examination of 35 cases of
extrasphincteric fistula of the rectum, the observation was made by the
author that fistulae which have been considered incomplete by the usual
probe-testing proved to be complete after injection of a dye under pressure.
Of the surgical treatments, slow sphincterotomy by threads led through the
extra-sphincteric fistula is considered the most effective. 3 Eastern

Summary
C. Rem - 62

The catalytic activity of a special type of alumina gel. Włodzisław Kuczyński and Przemysław Hoffmann (Univ. Poznań, Poland). *Keramika* **CH**, 28, 114 (1980) (English summary). — Kinetic measurements of catalytic dehydration of EtOH were made with 3 types of active hydrates of Al₂O₃ (gel I contg. 1.21% SO₄²⁻ at pH 7.0; gel II contg. 18.06% SO₄²⁻ at pH 6.5, and gel III contg. 4.66% SO₄²⁻ at pH 6.5). The studies were made at 320° and at 380°, the velocity of distillation equalling 0.0005 M/min. The velocity const. of the reaction in the presence of catalyst II was 3.5 times greater at 320° and 1.1–1.5 times greater at 380° than in the case of catalysts I and III. The energies of activation of dehydration of the catalysts I and III (18.2 and 21.5 kcal./mol., resp.) were found to be within usual limits but in the case of catalyst II it was too small (4.15 kcal./mol.). L. J. Potrowski.
